Last updated in Aug 2026

Alejandro Jeronimo Azamar

Manzanillo, Colima | alex.jeraza@gmail.com | 314 100 0104 | zama15.net | linkedin.com/in/zama15
github.com/Zama15

Skills

Languages: Spanish (Native C2), English (Intermediate B2)

Core: Linux, Bash, Git, GitHub, CI/CD, Algorithms, Data Structures

Languages: JavaScript, TypeScript, Python, PHP, Ruby, Java, Kotlin, C#

Web Frameworks: Ruby on Rails, Express, FastAPI, Laravel, Node, Node.js, NestJS, React, Vue

Data & Tools: PostgreSQL, MySQL, Prisma, Redis, AWS Cognito, Serverless, Notion, Slack, Clickup, Docker, Firebase, Unity, Blender

Experience

Software Engineer (Jr), EVCON Energy – Colima, Mexico — Aug 2026 – present

- Engineering the CMS admin portal for real-time charger-network monitoring, pairing a **React** + **TypeScript** dashboard with a **NestJS** REST/WebSocket backend deployed on AWS ECS Fargate.
- Developing the EMS SaaS platform's inverter-integration layer, unifying real-time data from Huawei FusionSolar, Solis, and Hoymiles APIs into a single customer-facing energy-balance and generation dashboard.
- Architecting the O&M module of the EMS platform — operations logging, alerting, and reporting — on Amazon Timestream for time-series generation data alongside RDS/**PostgreSQL** for relational state.
- Owning Core Web Vitals performance work and feature delivery on the EVCON public website in parallel with product development, prioritized via Kanban in **Clickup**.
- Extending internal tooling with new integrations, automations, and operational dashboards to support cross-team business workflows.
- Operating across four concurrent product lines (CMS, EMS, public site, internal tools) on a shared AWS foundation (Lambda, ECS/Fargate, Cognito, S3, SES, CloudWatch, Secrets Manager) with **Docker**-based **CI/CD** via **GitHub** Actions to ECR/ECS.

Developer Intern, EVCON Energy – Colima, Mexico — Feb 2026 – July 2026

- Built a centralized error-handling and resilience module — global exception filters, circuit breaker, and exponential-backoff retry service — eliminating manual error handling across all API controllers and standardizing HTTP error responses.
- Migrated a **NestJS** REST API to a **Serverless** deployment model and integrated a **Redis**-backed caching layer with configurable TTLs and automatic fallback, reducing external-provider query latency while maintaining 100% endpoint availability during simulated outages.
- Delivered an admin-controlled user provisioning system by orchestrating atomic dual-writes across **AWS Cognito** and **PostgreSQL** with automatic rollback compensation, preventing orphaned identity records on partial failures.
- Designed and shipped an IAM-style, multi-tenant permission system (role/permission groups, individual overrides, audit logging) that enforced partner-level data isolation across 5+ REST endpoints, validated by 1,000+ passing automated tests.
- Resolved post-review technical debt by consolidating duplicated authorization logic into a single centralized service and splitting a monolithic repository into two SRP-compliant adapters, cutting redundant database calls with zero regression across the full test suite.
- Proactively flagged specification gaps and self-reported implementation issues to the tech lead, driving scoped remediation tasks that closed each gap without disrupting delivery timelines.

Education

University of Colima, Bachelor's Degree in Software Engineering – Manzanillo, Colima — Aug 2022 – June 2026

- Relevant Coursework: Operating Systems, Linux Systems Administration, Databases, Advanced Databases, Data Structures

BrightCoders, Certification in Web Development – Manzanillo, Colima — Nov 2023 – May 2024

- Key Learning: Ruby, Soft Skills, Version Control

Projects

University of Colima Repository 2025-02 - 2025-12

- Gathered and analyzed client requirements (interviews, scope definition, use cases) to guide modular design.
- Designed a layered architecture (Domain / Application / Infrastructure / Presentation) with a microservices vision to ease future migration and independent deployments.
- Modeled and implemented a relational database in **PostgreSQL**: normalization, indexes, constraints, and query-oriented design.
- Implemented data access with **Prisma** ORM: versioned migrations, seeds, and use of transactions to keep consistency in critical operations.

Augmented Reality Game (Unity) 2025-08 - 2025-12

- Designed and developed an educational AR experience for high school, focused on interaction with 3D atomic models and small learning activities.
- Integrated Vuforia for tracking and AR content delivery.
- Used Lean Touch for multitouch gestures and natural manipulation of models.
- Implemented a login system with **Firebase** Auth (**C#**) and developed an adaptive TFUE (text, images, and audio) for different learning styles (visual, auditory).

Android SPA Mobile Application 2024-08 - 2024-12

- Developed a prototype app for beauty salons: conducted interviews with real spas to define goals and value flows (booking, schedules, location).
- Implemented MVVM architecture using **Kotlin** and screen design in XML.
- Integrated Google Maps for location management and schedule display; implemented booking functionality.
- Implemented navigation between screens with custom solutions in **Kotlin**/XML.

Web Forum Using Custom PHP Framework 2024-02 - 2024-06

- Developed a RoR-like MVC framework in vanilla **PHP**: routing system, controllers, and views with conventions that speed up new features and keep module coherence.
- Designed a relational schema in **MySQL** and created a custom ORM / Query Builder: data access abstraction, support for parameterized queries, and parameter binding to minimize SQL injection risks.
- Added facilities for composite queries and pagination.
- Implemented server view flow control: controllers, helpers, and reusable templates.
